

FINAL TECHNICAL MEMORANDUM #3

APPENDIX

Updated Correlation Tool

PRELIMINARY DRAFT

2007 Metro PCI Correlation Tool Instruction Sheet

Description

The Metro PCI Correlation Tool is a user-friendly spreadsheet that converts the 3R threshold of a jurisdiction's pavement condition index (PCI) to a normalized, countywide PCI (CPCI). This tool enables the Metro to calculate the estimated unmet backlog costs for 3R work on arterials and annual costs to maintain selected PCI threshold levels in the County of Los Angeles given knowledge of pavement management systems, PCI thresholds, and current local backlog and funding levels for arterials. This tool is only applicable to the jurisdictions of Los Angeles County and exclusively developed for Metro

This 2007 Version is an update from the original Metro PCI Correlation Tool developed in 2004. It incorporates the latest data from the 2007 System Preservation Survey. Two new Data Tabs were added in order to develop extrapolated unmet and annual costs and a new Cost Estimates Tab was added to calculate normalized County annual costs to maintain threshold.

PCI Correlator Tab

The PCI Correlator Tab is the main interface where most of the input data are located. The first column lists, in alphabetical order, all the jurisdictions in Los Angeles County that maintain streets with public access. For each jurisdiction, the user can select a pavement management system in the second column and enter a PCI threshold value for the selected system in the third column. These two columns are highlighted in yellow. It should be noted that users are only allowed to select from the list of available PMS systems.

Once data is entered, the Correlation Tool will automatically convert jurisdiction PCI threshold values to the Countywide PCI system and present the CPCI value in the fourth column. The formulas developed to convert jurisdiction PCI threshold values to Countywide PCI values are embedded into the Correlation Tool.

At the bottom of the table in the very last row is the average PCI threshold value for the entire County. This value is an average of the PCI thresholds for the County based on standardized PCIs from the local jurisdictions. Only correlatable systems are used to calculate the countywide average. (See below for additional description of correlatable systems.)

Normalized Cost Tabs

Normalized Unmet Costs

This Tab calculates normalized County unmet 3R backlog costs for arterials and based on a selected Countywide PCI threshold. The user can select a Countywide PCI

threshold from a drop down menu located at the top left corner of the Cost Estimates Tab. This Tab reads in the data from the PCI Correlator Tab and the Unmet Costs Data Tab to calculate the normalized costs at the selected CPCI threshold.

Normalized Annual Costs

This Tab calculates normalized County annual costs to maintain arterials at a PCI threshold selected in the Normalized Unmet Cost Tab. This Tab reads in the data from the PCI Correlator Tab and the Annual Costs Data Tab to calculate the normalized annual costs.

Data Tabs

Data - Correlation Curves

For the purposes of this Task Order the Metro adopted the US Army Corps of Engineers (USACE) PCI family of curves as the countywide PCI system due to the fact that it found to be the most commonly used basis for rating pavement conditions.

The PCI systems of all jurisdictions were evaluated with respect to their correlatability to the USACE system. For PCI systems that were deemed correlatable to the USACE system, a mathematical regression model was created to translate given threshold ratings to the USACE system. These regression models were developed by comparing specific data points representing similar pavement conditions from the non-USACE PCI system and from the USACE system.

Presented in this Data Tab are data points and mathematical curves for all PMS systems analyzed as part of this Task Order. PMS systems listed in this Data Tab were found to be in use by at least one Los Angeles County jurisdiction at the time of this Task Order.

Data - Surrogate PCI Thresholds

Where systems in use were found to be non-correlatable to the USACE system or where jurisdictions were found to have no PMS systems in place, a surrogate PCI threshold was developed using data from two donor jurisdictions with correlatable systems that have the following similar characteristics:

- General topographic conditions (flat, hilly)
- General soil conditions (alluvial plain, coastal, non-erodible)
- General traffic volumes (low, medium, high)
- General truck volumes (low, medium, high)

The numerical average of the correlatable PCI thresholds from the two donor jurisdictions is used to represent the PCI threshold value of the non-correlatable jurisdiction.

Data - Unmet Costs

This tab estimates extrapolated costs for jurisdictions that did not provide responses for 3R backlog costs and funding. Note that where backlog responses were reported to be less than funding responses, the backlog response was changed to match the funding response. The dataset is then fed into the Normalized Unmet Costs Tab to calculate normalized County unmet backlog costs.

Data - Annual Costs

This tab estimates extrapolated costs for jurisdictions that did not provide responses for annual costs to maintain PCI threshold. The dataset is then fed into the Normalized Annual Costs Tab to calculate normalized County annual cost to maintain threshold.

Spreadsheet Formats and Protection

Most areas in this Tool are read-only and password protected, except for two yellow-highlighted areas. One area is the Pavement Management System and the Provided PCI Threshold columns located in the PCI Correlator Tab. Another area is a yellowed cell located on the top left corner of the Normalized Unmet Costs Tab next to the cell labeled "Select CPCI Threshold". Clicking on this cell will give the user a drop down menu to pick the selected CPCI Threshold for calculating both the normalized County unmet backlog costs and the normalized County annual costs to maintain selected threshold. In these yellow-highlighted cells, the user is allowed to alter and save any entries and edits.

The password protection serves to permit users to select from the available pavement management systems and to prevent users from making unintentional calculations and edits.

Data - Correlation Curves - 14

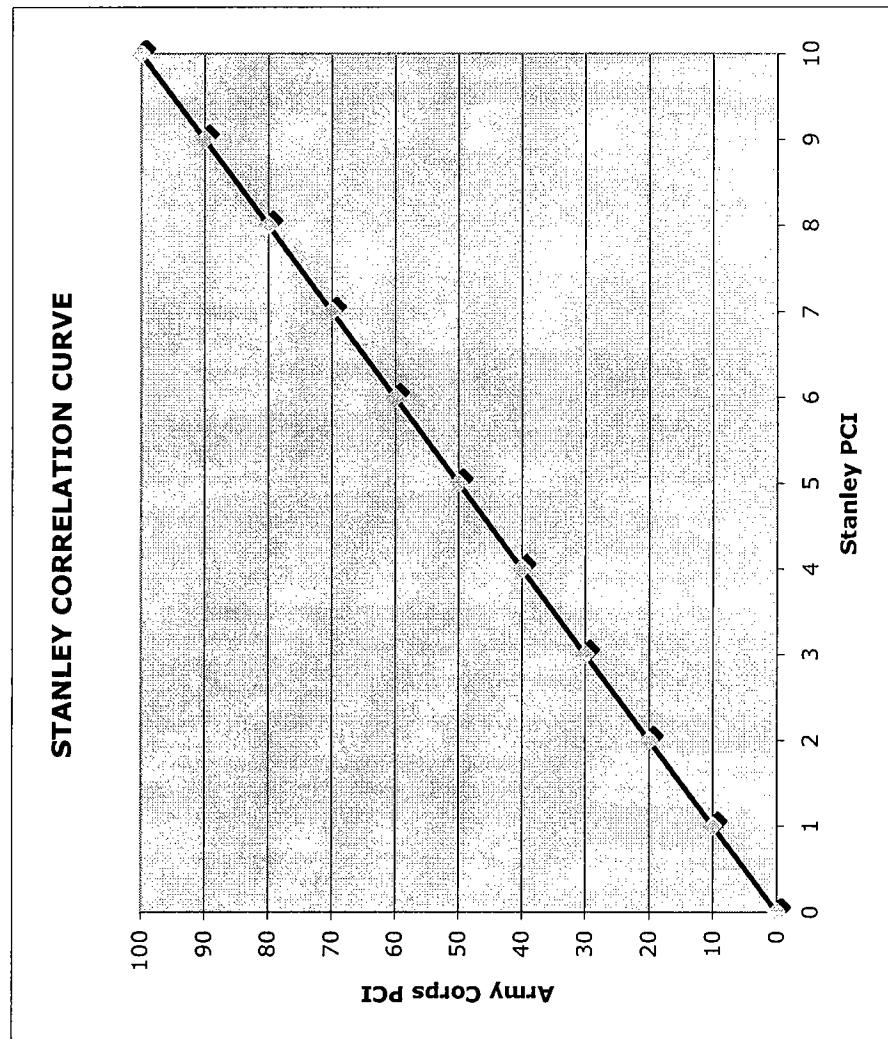

Appendix

Metro PCI Correlation Curves

PMS System: ITX STANLEY

Stanley's system provides a PCI value from 0-10 with 7 being the threshold for 3R work.
This essentially correlates to the Army Corps if you multiply by a factor of 10.
