PORTUGUESE BEND LANDSLIDE

Report on Mud Extrusion in Tidal Area.

A geological extrusion runs along the shore and immediate offshore area at Portuguese Bend. This was located at low tide June 29th A.M. Its approximate widths and directions are shown in the accompanying field notes.

This mud coverd a large area in a number of places being a continuous solid mass, while in other places it was much less apparent especialy where it was not pushed all the way up among the rocks but lay between and below them.

Never-the-less it was fairly easy to trace the substance by strips and patches even where it did not appear in large quantities. Its width was found to vary from 6 to 30 feet. This out cropping also seemed to follow the shore line along about -1 to +1 foot reletave to MLLW. This it did from the head land northwest of the pier until it evidently went into the shore and cliffs near the first house on the beach. The exceptions are where it passed under large rock mounds at the pier and the small cove. The extrusion reappears in the tidal zone again farther down coast where the rocky beach begins again. It finaly goes into shore and is lost from view just past the end of our beach control line. of Beach 5

Its consistancy varied from fairly firm and slick to very soft and mushy. Its color also varied from white to many shades of brown and grey. It was strikingly distinguishable from the ordinary beach sand and rocks.

M. A. Van Deren 6-29-57

To be filed with field notes F.B. 2305/119-127
