FOUNDATION REQUIREMENTS ON EXPANSIVE SOIL

One- and Two-Story Dwellings of Group R-3, R-3.1, and R-4 Occupancies and Accessory Buildings of Group U Occupancy

ISSUE

Foundation systems on expansive soils shall be designed and constructed in a manner that will minimize damage to the building from the movement of the soil. Slab-on-grade and mat-type footings for buildings located on expansive soils shall be designed in accordance with Section 1808.6 or an engineering design based on geotechnical report(s) as approved by the Building Official. When such approved design and methods of construction are not provided, the prescriptive requirements listed below may be used (see attached diagram).

POLICY

1. All exterior wall foundations and interior bearing wall foundations shall extend not less than 24 inches and 18 inches, respectively, below undisturbed ground surface or finish grade (certified fill).

2. Exterior walls and interior bearing walls shall be supported on continuous foundations.

3. Foundations shall be reinforced with a minimum of four continuous horizontal reinforcing bars. At least two 1/2-inch-diameter (No. 4-bar) deformed reinforcing bars shall be placed within 4 inches of the top of the footing and at least two 1/2-inch-diameter (No. 4-bar) deformed reinforcing bars shall be placed between 3 inches and 4 inches of the bottom of the footing.

4. Foundations for exterior walls and interior bearing walls shall be tied to the floor slabs by reinforcing bars (dowels) having a diameter of not less than 1/2-inch (No. 4-bar) and spaced at intervals not exceeding 16 inches on center. The reinforcing bars shall extend at least 40 diameters into the footings and the slab. Dowels may be omitted when slab is a monolithic pour.

5. Concrete floor slabs-on-grade shall be cast over two layers of 2-inch sandfill with a minimum 6-mil moisture barrier membrane sandwiched between the two 2-inch layers. The slab shall be at least 4 inches thick and shall be reinforced with No. 4-bar at 16 inches on center each way.
6. The soil below an interior concrete slab shall be saturated with clean water to a depth of 18 inches prior to pouring the concrete.

Note: Construction sites located within designated liquefaction zones shall comply with the more restrictive foundation detailing requirements of BCM 1803.5.11, Article 1 (BCM No. 034).

Supersedes BCM 1808.6 Article 1 dated 09-15-14
