

November 1, 2018

Mr. Martin Aiyetiwa
Senior Civil Engineer
County of Los Angeles, Department of Public Works
900 South Fremont Avenue
Alhambra, CA 91803-1331

Subject: Sunshine Canyon Landfill, Quarterly Vegetation Report
Third Quarter 2018 Vegetation Report

Mr. Aiyetiwa,

This report has been prepared in accordance with the following:

- Condition 18B of the Finding of Conformance;
- Condition 44A of the Condition Use Permit (CUP)
- Los Angeles City Condition [Q] C.8 of the Ordinance No. 172,933.

This report presents the progress of the site's landscaping and revegetation activities for the third quarter of 2018. The intent of these reports is to provide detailed information regarding the site's efforts related to vegetation including vegetation of interim and permanent slopes and activities conducted for the on-site sage mitigation areas.

Architerra Design Group continues to assist site personnel in evaluating current site conditions relating to vegetation and provide recommendations for future efforts. This report includes their assessment of the pilot sage vegetation area as well as recommendations for this area. Architerra's evaluation is in addition to the required quarterly monitoring performed by our consulting biologist.

1.0 Interim Slopes

For the purposes of this report, interim slopes are those defined as slope areas where no activities have taken place for 180 days or longer. CUP Condition 44A requires "a temporary hydroseed vegetation cover on any slope

or landfill area that is projected to be inactive for a period of greater than 180 days”.

1.1 Hydroseeding Activities

Based on the results of the trial project completed in August 2017, a 57 acre vegetative cover project using the approved seed mix was completed in mid-December 2017. Currently, these areas are established and in a dormant state, watering efforts will commence next year on an as-needed basis once the rainy season has passed.

The site is currently undergoing preparations for hydroseeding approximately 15 acres; application of the approved seed mix will be completed by the end of the fourth quarter in 2018.

2.0 Permanent Slopes

Permanent slopes are defined as those where no landfilling activities will be conducted in the future.

2.1 City

The permanent slopes on the City portion of Sunshine Canyon Landfill are located on the closed City South and City North areas of the site where no overliner will be placed during future cell development (Drawing 1 – Sage Mitigation Area). No vegetation activities were conducted on the permanent slopes on the City portion of the site during the third quarter of 2018.

2.2 County

No vegetation activities were conducted on the permanent slope areas on the County portion of the site during the third quarter of 2018 (Drawing 1 – Sage Mitigation Area).

3.0 Non-Permanent Cut Slopes

Prior quarterly vegetation reports have illustrated one area above the front terminal sedimentation basin and one area near the temporary bypass road as “non-permanent cut slopes”. An evaluation of these areas has been conducted and it has been determined that these areas are “permanent

slopes” because no landfilling activities will be conducted against these slopes in the future.

4.0 Activities Conducted in Sage Mitigation Areas – 3Q2018

During the third quarter of 2018, the following activities were conducted in the sage mitigation areas at the landfill.

4.1 City South Sage Pilot Project Area – Deck C

The following activities were conducted:

- Maintenance activities removal of invasive plant species and weeding activities.
- Selective pruning of saltbush.

4.2 City South Deck B

The Deck B sage mitigation project began on April 9, 2018 and is expected to be done by the end of the fourth quarter. Soil samples indicate low pH and high salinity, currently the Deck B is undergoing a leaching schedule. Additional soil amendments and resampling will need to be completed before planting can begin, which is expected to take place during the fourth quarter. Pacific Restoration Group, Inc (PRG) has been working with Architerra for the completion of project. A summary of the progress is included in Attachment 3.

4.3 County Sage Mitigation Area

The County sage mitigation area is located on the western side of the County portion of Sunshine Canyon Landfill (Drawing 1). No revegetation activities were conducted in this area during the third quarter of 2018, and, as noted in multiple JMA progress reports, the conditions in this mitigation area have remained unchanged for some time. JMA notes in their attached third quarter vegetation report that this area is problematic for establishment of vegetation. Soil samples from this location indicate low pH, high salinity, and Boron present in native soils.

5.0 Assessments of Sage Mitigation Areas

Assessments of the site's sage mitigation areas are conducted by a qualified biologist on a quarterly basis. The following sections present a summary of the recommendations for the sage mitigation areas from JMA (City and County sage mitigation areas) and Architerra (City South Sage Pilot Project Area (Deck C) and the proposed actions in response to the recommendations.

5.1 JMA Recommendations for City Sage Mitigation Areas

JMA's progress reports for the City Sage Mitigation Areas for the third quarter of 2018 are provided in Attachment 1. These reports include recommendations based on the assessments. Table 1 presents a summary of these recommendations and the proposed actions.

Table 1 – JMA Recommendations and Proposed Actions – City Sage Mitigation Areas, Third Quarter 2018

| AREA | | RECOMMENDATION | PROPOSED ACTION |
|-------------------------|---|---|--|
| LOWER DECK (Deck C) | 1 | Continue to monitor | Monitoring will be conducted and documented by our consultants on an ongoing basis |
| DECKS A (Upper Deck) | 2 | Improve root zone and soil conditions | This will be addressed when the plans for Decks B and A are developed. Actions were taken to address improving the root zone in the pilot project area (Deck C); it is expected these same actions will be incorporated into the plans for Decks B and A |
| DECKS A (Upper Deck) | 3 | Plant Natives in Areas Dominated with Non-Natives. Use various planting methods (i.e. container plants and hydroseeding) to re-establish native plants on the middle and upper decks where non-natives currently dominate | This will be addressed when the plans for Decks B and A are developed. Various planting methods were used for the construction of the pilot project on Deck C; it is expected these same actions will be incorporated into the plans for Decks B and A |

| | | | |
|--|---|--|--|
| DECKS C, B AND A (Lower, Middle, and Upper Decks) | 4 | Weed Control - implement a year-round weed control program to control non-native species | A weed control program is currently in place on Deck C as part of the pilot project and will continue. A weed control program on Decks B and A will be implemented along with the mitigation plans for these areas |
| DECKS A | 5 | Reseeding - apply native seeds during the rainy season after soil mounds have been established | This will be addressed when the plans for Decks B and A are developed |
| DECKS A, B, and C | 6 | Prohibit access - continue to prohibit vehicle access to mitigation areas | Repairs to the T-post fencing will be made as needed |

JMA also recommended that a monitoring biologist should be present during weed control activities or the native plants should be flagged to ensure only non-native species are removed. A monitoring biologist will be consulted prior to any weed control activities to ensure native plants are protected.

5.2 JMA Recommendations for County Sage Mitigation Area

Table 2 presents a summary of the recommendations proposed by JMA based on the assessment of the County Sage Mitigation Area and the proposed actions. Please refer to the full recommendations in the JMA reports in Attachment 2.

Table 2 – JMA Recommendations and Proposed Actions – County Sage Mitigation Area, Third Quarter 2018

| AREA | RECOMMENDATION | | PROPOSED ACTION |
|-----------------------------|----------------|--|--|
| COUNTY SAGE MITIGATION AREA | 1 | Create benches to control soil erosion and improve soil conditions to improve plant establishment and seed dispersal | This recommendation will be considered at a later date |
| COUNTY SAGE MITIGATION | 2 | Reseed and plant container plants | This recommendation will be considered at a later date |

| AREA | | | |
|-----------------------------|---|-------------------------|--|
| COUNTY SAGE MITIGATION AREA | 3 | Plant within view sheds | This recommendation will be considered at a later date |
| COUNTY SAGE MITIGATION AREA | 4 | Use soil amendments | This recommendation will be considered at a later date |
| COUNTY SAGE MITIGATION AREA | 5 | Signage | This recommendation will be considered at a later date |
| COUNTY SAGE MITIGATION AREA | 6 | Weed control | This recommendation will be considered at a later date |
| COUNTY SAGE MITIGATION AREA | 7 | Prohibit access | This recommendation will be considered at a later date |
| COUNTY SAGE MITIGATION AREA | 8 | Employee awareness | This recommendation will be considered at a later date |

5.3 Architerra Inspection for City South Sage Mitigation Pilot Project Area – Third Quarter 2018

The inspection report is included in Attachment 3 along with photos of the area taken at the photo stations.

5.4 Quarterly Assessment of City South Sage Pilot Project Area

The methodology for assessment of the City South Sage Pilot Project Area developed by JMA was included in the first quarter 2015 Vegetation Report. The evaluation report for the third quarter of 2018 based on this methodology is included in Attachment 4.

6.0 Status of Other Vegetated Areas

Big Cone Douglas Fir Tree Mitigation

As reported in the vegetation report for the first quarter of 2015, 200 Big Cone Douglas fir tree saplings were planted the third week of March 2015. These trees continue to be monitored and maintenance activities will be conducted in this mitigation area for the remainder of 2018.

Please do not hesitate to contact me at (818) 362-2096 if you have any questions.

Sincerely,

Tuong-Phu Ngo, P.E.
Environmental Manager

SUNSHINE CANYON LANDFILL MITIGATION SITES

Progress Report

City-Side Sage Mitigation Area

| | | | |
|--|--|--|--|
| Submittal Date: October 31, 2018 | | Inspection Date: October 28, 2018 | |
| To: Tuong-phu Ngo, Environmental Manager | | From: Greg Ainsworth, Monitoring Biologist <i>*Prepared on behalf of Republic Services</i> | |
| Lower Deck | | | |
| <p>General Comments: The saltbush (<i>Atriplex polycarpa</i> and <i>A. lentiformis</i>) is partially dormant; however, several seedlings are vegetating within the canopy, most notably <i>Atriplex lentiformis</i>. Seedlings of other native species such as <i>Encelia Californica</i>, <i>Artemisia californica</i>, and <i>Salvia sp.</i> occur within the saltbush canopy; however, in less quantity.</p> <p>The winds were approximately 25 mph during the assessment; therefore, few wildlife species were observed. However, several side-blotched lizard (<i>Uta stansburiana</i>) were observed.</p> | | | |
| Native Plant Cover: <input type="checkbox"/> Dense <input checked="" type="checkbox"/> Moderate <input type="checkbox"/> Minimal | Plant Health Issues: <input type="checkbox"/> Disease/pests <input type="checkbox"/> Plant stress <input type="checkbox"/> Herbivory | Height of Native Species: <input type="checkbox"/> 0" – 12" <input type="checkbox"/> 12" – 24" <input checked="" type="checkbox"/> 24" and above | Native Species Richness: <input checked="" type="checkbox"/> Low <input type="checkbox"/> Medium <input type="checkbox"/> High |
| Weed Conditions | | | |
| <input type="checkbox"/> Dense weed coverage <input checked="" type="checkbox"/> Moderate weed coverage (seeding in high density) <input type="checkbox"/> Minimal weed coverage | | <input type="checkbox"/> Weeds germinating /vegetative growth <input type="checkbox"/> Weeds flowering <input type="checkbox"/> Weeds setting seed <input checked="" type="checkbox"/> Weed desiccant/dormant | |
| <p>Comments Most weeds are currently dormant within the lower deck, including Russian thistle (<i>Kali tragus</i>), mustard (<i>Hirschfeldia incana</i>), wild oats (<i>Avena fatua</i>) and brome grasses (<i>Bromus sp.</i>). .</p> | | | |
| Middle Deck | | | |
| <p>General Comments: Approximately 60% of the Middle Deck has been tilled in preparation for planting native seed. Planting will occur primarily in areas where few native species had established from prior seeding, largely due to compacted and gravelly soils. Large boulders have been strategically</p> | | | |

26623 Sierra Vista
Mission Viejo, CA 92692
949-367-1000
www.jma-ca.com

positioned within the planting area and straw waddles have been installed to control erosion, and to save as basins to establishing seed.

There is a decent mixture of native species that have established on the Middle Deck from previous planting efforts that include California buckwheat (*Eriogonum fasciculatum foliosium*), black sage (*Salvia mellifera*), purple needlegrass (*Nessella pulchra*), California sagebrush, and chamise (*Adenostoma fasciculatum*).

| | | | |
|---|---|---|--|
| Native Plant Cover: [] Dense [] Moderate [X] Minimal | Plant Health Issues: [] Disease/pests [] Plant stress [] Excessive herbivory | Height of Species: [] 0" – 12" [] 12" – 24" [X] 24" and above | Native Species Richness: [X] Low [] Medium [] High |
| Weed Conditions | | | |
| [] Dense weed coverage [X] Moderate weed coverage (seeding in high density) [] Minimal weed coverage | | [X] Weeds germinating /vegetative growth [X] Weeds flowering [] Weeds setting seed [] Weed desiccant/dormant | |
| Comments: Weed coverage is low within the middle deck as a result of recent tilling and preparation for seeding. | | | |
| UPPER DECK | | | |
| <p>General Comments: Overall, the Upper Deck continues to be sparsely covered with native vegetation, and total vegetation coverage is sparse due to compacted and poor soil conditions. Specifically, the soils to the north of the central access road are heavily compacted and gravelly and vegetation coverage in this area is especially sparse. Evidence of previous seeding is no longer discernible.</p> <p>Wild oats (<i>Avena fatua</i>), brome grasses and mustard have senesced, but continue to dominate the non-native cover throughout the upper deck. Seedlings of Russian thistle have emerged in various location within the upper deck where soil are less compacted. Buckwheat is the dominant native plant, which is most prevalent at the southwestern portion of the upper deck. Overall natural recruitment within the Upper Deck is low, due to poor soil conditions and dry soil.</p> | | | |

Comments: Weeds continue to grow without any level of control within the Upper Deck. Weeds generally consist of senesced Russian thistle, wild oats, brome grasses and mustard.

RECOMMENDATIONS

Lower and Middle Decks

- **Weed control.** Implement a year-round weed control program to control non-native species. The weed control program should incorporate both chemical and mechanical control practices. Following weed control, any dead material harboring seeds should be removed to an off-site location to the extent feasible.

A monitoring biologist should be present during weed control activities or flag the native plants that should remain to ensure only non-native species are removed. A biologist should verify that the weed removal methodology is sound and does not encourage re-colonizing of non-natives. Weeding is best performed just before, or at the onset of flowering, but before seed set. If seeds are already present, additional care should be taken to remove the plants with the seeds attached, or the seeds should be removed from the plants prior to the plant removal. A consistent weed abatement schedule will reduce the potential for non-natives to set seed. Soil disturbance should be limited by hand weeding, where possible, and weeds should be disposed of off-site to avoid any reinfestation through reseeding or from plant propagules. If hand weeding is not possible, the monitoring biologist should be consulted regarding the appropriate method of weed removal. If there continues to be high incidence of weed infestation, weed control may need to be increased to every four to six weeks. Otherwise, weeds should continue to be monitored and controlled on a quarterly basis.

- **Prohibit access.** Continue to prohibit vehicle access to mitigation areas.

Upper Deck

- **Improve root zone and soil conditions.** Continue to investigate ways to import the soil layer to improve the root penetration and saturation zone to enable plant growth in heavily compacted areas. Consider applying soil in random undulations or uneven mounds to improve soil porosity and filtration and to control soluble salts from leaching from existing layer.

If permissible, prior to seeding (broadcast, hydroseeding, or drilling) native species, incorporate a soil amendment or mulch with high organic content by tilling into the top 12 inches of the existing compacted soils to improve soil texture, drainage, porosity, and aerobic conditions. If an organic mulch or soil amendment is not feasible or available, incorporate available soil from on-borrow sites within the landfill that have the appropriate, so long as these borrowed soils have been determined to not have toxic conditions such as boron or high salinity.

- **Plant natives in areas dominated with non-natives.** The vegetated areas on the Upper Deck that are currently dominated with annual, non-native species, as well as with native shrubs, have decent soil-texture conditions. These areas are not near as compacted as areas within the Upper Deck that are gravelly and mostly void of vegetation. In general, the soil texture within the

26623 Sierra Vista
Mission Viejo, CA 92692
949-367-1000
www.jma-ca.com

vegetated areas with non-native vegetation is friable down to approximately 4-8 inches in depth. Various planting methods (i.e., broadcast, imprint, and hydroseeding) may be used to re-establish native plants on the Upper Deck where non-natives currently dominate.

- **Weed control.** Implement a year-round weed control program to control non-native species. The weed control program should incorporate both chemical and mechanical control practices. Following weed control, any dead material harboring seeds should be removed to an off-site location to the extent feasible.

A monitoring biologist should be present during weed control activities or flag the native plants that should remain to ensure only non-native species are removed. A biologist should verify that the weed removal methodology is sound and does not encourage re-colonizing of non-natives. Weeding is best performed just before, or at the onset of flowering, but before seed set. If seeds are already present, additional care should be taken to remove the plants with the seeds attached, or the seeds should be removed from the plants prior to the plant removal. A consistent weed abatement schedule will reduce the potential for non-natives to set seed. Soil disturbance should be limited by hand weeding, where possible, and weeds should be disposed of off-site to avoid any reinfestation through reseeding or from plant propagules. If hand weeding is not possible, the monitoring biologist should be consulted regarding the appropriate method of weed removal. If there continues to be high incidence of weed infestation, weed control may need to be increased to every four to six weeks. Otherwise, weeds should continue to be monitored and controlled on a quarterly basis.

- **Reseeding.** Following the application of soil mounds as previously described, apply native seed (by means of broadcast seeding, hydroseeding or drilling) during the rainy season, between December and March, or prior to a forecasted rain event.

- **Prohibit access.** Continue to prohibit vehicle access to mitigation areas.

SUNSHINE CANYON LANDFILL MITIGATION SITES

Progress Report

County-Side Sage Mitigation Area

| | |
|---|--|
| Submittal Date: October 31, 2018 | Inspection Date: October 28, 2018 |
| To: Tuong-phu Ngo, Environmental Manager | From: Greg Ainsworth, Monitoring Biologist <i>*Prepared on behalf of Republic Services</i> |
| STATUS OF HYDROSEEDING | |
| Conditions: <input type="checkbox"/> Fully covered <input type="checkbox"/> Moderately covered <input checked="" type="checkbox"/> Barely covered | |
| Comments: <p>Conditions on the county-side sage mitigation area remain relatively unchanged. Areas that are moderately covered with vegetation (native and non-native) are concentrated to the southern half of the slope. A substantial portion of the northern-half of the county-side mitigation area continues to be bare and problematic for establishment of vegetation, primarily because of erosion, steep slopes and toxic soils (See Recommendations).</p> <p>Native plant coverage is similar to the previous quarterly monitoring reports. The southern-half of the mitigation area contains the most vegetation with a substantial portion of the vegetation cover dominated with native species, most notably California buckwheat, <i>Eriogonum fasciculatum</i>. Native plant coverage is assumed to be a direct result of hydroseeding; however, some natural recruitment is apparent based on the dense cover where native vegetation is present, and the various sizes and structure of the shrubs. Due to rocky (hydrophobic) soil conditions, soil erosion and Boron toxic soils on the northern-half of the county-side mitigation area, minimal plant growth is present.</p> | |
| SEED MIX | |
| Conditions: <input type="checkbox"/> No sign of germination <input type="checkbox"/> No cover of native plants from seed mix <input type="checkbox"/> Sparse cover of native plants from seed mix | <input type="checkbox"/> Dense cover of native plants from seed mix <input checked="" type="checkbox"/> Moderate cover of native plants from seed mix (where vegetation is present) |
| Comments: <p>Similar to the hydroseeded areas, the other areas that are moderately covered with vegetation are concentrated in the southern-half of the slope. A substantial portion of the county-side mitigation area continues to be bare and problematic for vegetation to become established. However, in areas where vegetation is present, there is a moderate coverage of native species, mostly California buckwheat.</p> | |

26623 Sierra Vista
Mission Viejo, CA 92692
949-367-1000
www.jma-ca.com

Germination and plant growth from hydroseeding or seed mix is not discernible. Similar to previous monitoring periods, a moderate cover of native plants exists within vegetated areas. Annual non-native grasses and forbs currently dominate the understory and serve as ground cover in most of the vegetated areas. Brome grasses (*Bromus sp.*), wild oats (*Avena fatua*) and shortpod mustard (*Hirschfeldia incana*) are currently senesced, but still comprise approximately 25 percent of the vegetation cover. California buckwheat dominates the native vegetation coverage, with California sagebrush (*Artemisia californica*) and California sunflower (*Encelia californica*) as co-dominants. These native species comprise of approximately 75 percent of the native vegetation cover (in areas where vegetation is present). Other less dominant native species observed include golden bush (*Ericameria linearifolia*), coyote brush (*Baccharis pilularis*), black sage (*Salvia millifera*), laurel sumac (*Malosma laurina*), and a small cluster of arroyo willow (*Salix lasiolepis*) trees that continue to thrive along the v-ditch that extends east-west through the center of the mitigation site.

OVERALL NATIVE PLANT CONDITIONS

| | | | |
|---|---|--|---|
| Plant Cover: [] Dense [] Moderate [X] Minimal | Plant Health Issues: [] Disease/pests [] Plant stress [] Excessive herbivory | Height: [] 0" – 12" [X] 12" – 24" [] 24" and above | Species Richness: [] Low [X] Medium [] High |
|---|---|--|---|

Comments:

Vegetation cover on the "county slope" is most prevalent on the southern half of the restoration area, with the greatest density of vegetation in the center. The majority of the northern and upper portions of the mitigation area continue to have minimal coverage due to erosion, rocky soils and boron toxicity. Bare areas and non-native annual grasses are intermixed, but characterizes the northern half of the restoration area. Native vegetation density and richness is good in vegetated areas, and the non-native grasses cover is typical of the native, undisturbed areas that surround the landfill.

As indicated previously, California buckwheat dominates the native cover with *Encelia californica* as a co-dominant. Establishment and regeneration of native vegetation is problematic on the upper and northern portions of the restoration area due to rocky soils with poor soil structure, and boron toxicity has made plant growth (i.e., seed germination and recruitment) difficult. The species richness is low to medium within vegetated areas; however, species richness is considerably low when considering the entire county-sage mitigation area.

WEED CONDITIONS

| | |
|--|--|
| Conditions: [] Dense weed coverage [X] Moderate weed coverage (seeding in high density) [] Minimal weed coverage | [] Weeds germinating [X] Weeds flowering [X] Weeds setting seed [] Weed desiccant/dormant |
|--|--|

26623 Sierra Vista
Mission Viejo, CA 92692
949-367-1000
www.jma-ca.com

Comments:

Annual, non-native weed species consist primarily of brome grasses (*Bromus* sp.), shortpod mustard, and wild oats (*Avena fatua*), all of which are currently senesced. Other established weedy species that were observed include red-stemmed filaree (*Erodium cicutarium*) and (native) telegraph weed (*Heterotheca grandiflora*). Russian thistle (*Salsola kali*) and tree tobacco (*Nicotiana glauca*) are scattered within the vegetated areas, but in less densities than the other non-native species noted above.

MISCELLANEOUS**Conditions:**☐ Trash☐ Vandalism☐ Erosion**Comments:**

None

RECOMMENDATIONS

- **Create benches.** Consider creation of benches throughout the mitigation area to control soil erosion and to improve soil conditions to improve plant establishment and seed dispersal. This technique has been widely used on steep slopes and in areas where soil erosion is problematic. This technique also allows for opportunities to introduce a high quality soil layer above the poor soils that exist.
- **Reseed and plant container plants.** If creation of benches is feasible, planting methods should include Hydroseeding and broadcast seeding just before a forecasted rain event and planting with container plants with supplemental irrigation during the period of establishment. Container plants should only be planted if temporary irrigation source is available.
- **Plant within view sheds.** Consider planting native species on upper portion of the slope that is visible from public view sheds with appropriate native species. Planting should occur prior to fall/winter rains.
- **Use soil amendments.** Incorporate a soil amendment or mulch with high organic content in select areas as determined by a restoration specialist.
- **Signage.** Install signs indicating that the area is undergoing revegetation.
- **Weed control.** Continue weed control program as needed on a quarterly basis.
- **Prohibit access.** Continue to prohibit vehicle access to mitigation area. Extend fencing around southeastern and southern boundary of lower deck and review fencing on the upper deck to determine if additional area can be reasonably enclosed.
- **Employee awareness.** Conduct an employee awareness program to inform staff on the importance of preserving all restoration areas.

ARCHITERRA DESIGN GROUP

FIELD OBSERVATION REPORT

| | |
|----------------------------------|--------------------------------------|
| DATE OF VISIT: | 10/17/18 |
| PROJECT: | Sunshine Canyon Mitigation Sites |
| PROJECT NUMBER: | 1214 |
| PROJECT MANAGER: | Gregg Denson |
| SITE INSPECTION #: | |
| PURPOSE OF VISIT: | Review site conditions/Photo Catalog |
| TIME OF SITE VISIT: | 11:00am |
| WEATHER/TEMPERATURE: | Sunny and Breezy 85° |
| ESTIMATED % COMPLETED: | 100% |
| CONFORMANCE WITH SCHEDULE (+, -) | |

| | |
|-------------------|--|
| WORK IN PROGRESS: | Weed abatement / Monitoring Period /Construction Observation |
| PRESENT ON SITE: | Gregg Denson |

A site visit walk and evaluation has been completed to review the Venturan CSS vegetation establishment on the Trial Site (Deck C), Deck B and County Mitigation Slopes. Additional items noted during the site visit are as follows:

City-Side Sage Mitigation (Trial Site):

- With recent rains in early October, Russian Thistle (*Salsola* ssp.), Shortpod Mustard (*Hirshfeldia incana*), Tree Tobacco (*Nicotiana glauca*), and Tamarix and Eucalyptus Species are actively germinating. These invasive weeds should be immediately be removed prior to flowering. The maintenance contractor should use caution when removing invasive weeds so that juvenile CSS plants remain in place. Identification of targeted invasive species are key to successful removal without disturbance of CSS species.
- Many of the CSS natives are still in the dormancy period. Some of these include, Coast Sunflower (*Encelia californica*), Black Sage (*Salvia mellifera*), Purple Sage (*Salvia leucophylla*), White Sage (*Salvia apiana*), Creeping Wild Rye (*Leymus triticoides*), Deerweed (*Lotus scoparius*), Mexican Elderberry (*Sambucus mexicana*). California Buckwheat (*Eriogonum fasciculatum*) has finished flowering and has gone to seed.
- Highest priority for Deck C is removal of invasive species.
- Discussions regarding the PM10 Berm included review of the existing Coast Live Oak trees along the south side of Deck C where evident foliage damage occurred and as a result of sun scald during the extreme heat wave a few months ago (estimated max. daytime temperatures to 118°). Upon review of the trees, it appears that they could benefit from supplemental irrigation. Some foliage has begun to recover now that daytime temperatures are more favorable. ADG recommends irrigating these Oaks weekly with a deep watering (from existing drip system) and inspecting system to make sure it is properly working including drip emitters and bug caps at distribution tubing ends. Additional recommendations include planting native large shrubs (at 1 gallon containers)

to be dispersed between Oaks to help close cover of the PM10 Berm and potentially aid in shading understory of the Oaks and minimizing the quick moisture loss due to dry daily winds that blow over the ridge where the PM10 Berm exists. Recommended species include *Rhus integrifolia* (Lemonade Berry) and *Heteromeles arbutifolia* (Toyon).

Side-Blotched Lizard hiding in leaf litter of Atriplex

Coast Sunflower seedlings still in dormancy

Dormant Black Sage awaits winter rains

Dormant Deerweed (*Acmispon glaber* -formally *Lotus scoprius*) appears as dry sticks

Eucalyptus sapling (8'-10') – several exist on deck and should be removed

Coast Sunflower (*Encelia californica*) in dormancy at downstream side of straw wattle

Black Sage and California Sagebrush seedlings comparison (Spring – Left, Fall – Right)

Local Bird perched on Saltbush

Defoliated Black Sage

Sunscald on vegetation of Oak Trees at PM10 Berm

Galls on some branches from Gall Wasps

Healthy Oak Trees at PM10 Berm beginning to close the canopy along east end where there is more protection for prevailing winds

Struggling Oaks shown circled in red and healthier more vigorous growth in green circled area

Suggested large native shrubs to be planted and dispersed between Oaks to help close cover of the PM10 Berm and potentially aid in shading understory

(Left - *Rhus integrifolia* Right - *Heteromeles arbutifolia*)

Good example of Saltbush as primary succession species providing shelter cover for new Venturan CSS species seedlings

City-Side Sage Mitigation (Deck B):

- Soils testing will occur during the 4th quarter of 2018 in preparation for soil amending and seeding/planting.
- Currently some germination has occurred in selected areas within the graded deck project area

Growth of new seedlings of Atriplex on Deck B

New grasses germinated at swale line (straw wattle repair needed in some areas)

Invasive Castor Bean to be removed

View of deck look east with boulders set into graded swales

Newly germinated Tree Tobacco (*Nicotiana glauca*) to be removed

North East end of Deck B project area where Mustard and Saltbush have germinated

Caution should be taken as to not remove desirable species like the *Encelia Californica*

Shortpod Mustard and Coast Sunflower intermixed along eastern edge of deck

Irrigation was not properly working at time of visit. Appeared to be a pressure issue with radius throw only 1/3 of designed distance

ATTACHMENT 4

memorandum

date October 31, 2018

to Tuong-phu Ngo, Environmental Manager, Republic Services

from Greg Ainsworth, Consulting Biologist

subject Coastal Sage Scrub City South C Trial Plot Monitoring Report, Sunshine Canyon Landfill –
 3rd Quarter, 2018

INTRODUCTION

On October 26, 2018, biologist Greg Ainsworth monitored the coastal sage scrub revegetation area at the Landfill's City South 'C' Trial Plot, which constitutes the 3rd quarter monitoring of the trial plot for 2018. The sample methodology generally followed the *Methodology for Monitoring Percent Cover and Species Richness within Each Seeded Application Method on the Coastal Sage Scrub Pilot Project at the Sunshine Canyon Landfill* (JMA, April 23, 2014). Quadrat sampling of the sage pilot study area consists of four, 50-meter quadrats that are randomly sampled within each of the following three seeded areas: hydroseed, imprint and hand broadcast. The quadrats were randomly selected prior to the first initial monitoring event from a grid that was placed over the entire trial plot, and each quadrat is delineated in the field with wooden stakes. As shown on the attached planting plan, each quadrat that was sampled was given a corresponding letter from A-L.

A total of 200 meters were sampled for each of the three seeded areas and the following data was collected in each quadrat that was sampled:

- **Percent basil cover (shrubs)** – Visual estimate of the amount of basil cover within each quadrat for all shrub species.
- **Percent basil cover (herbs)** – Visual estimate of the amount of basil cover within each quadrat for all herb species.
- **Percent bare ground** – Visual estimate of the amount of available bare ground with no vegetation, but suitable for plant growth.
- **Percent rock or other** – Visual estimate of the amount of unavailable ground for supporting plant growth. Inhibitors generally included rocks and boulders, irrigation lines and valve boxes, and mulch.
- **Percent canopy** – Visual estimate of the percent canopy of each shrub and herbaceous species.
- **Photographs** – A photograph was taken from the southwest corner (facing northeast) of each quadrat.

To obtain estimate cover of each species, the point intercept method was used, which consisted of data collection points every 0.5 meter along the perimeter of each quadrat. Sampling began at the southwest corner of each quadrat and continued around the quadrat in a clockwise direction. The species located precisely at every 0.5-meter point was tallied, including areas of bare ground, rock and other.

RESULTS

Below are the average data collected for the hydroseed, imprint, and hand broadcast application areas. The number in parenthesis represents the previous quarterly monitoring results.

Quadrat Sampling:

Average Hydroseed – Quadrats A, B, C, D

Percent basil cover (shrubs) – 17% (17%)

Percent basil cover (herbs) – 17% (17%)

Percent bare ground – 44% (44%)

Percent rock or other – 3% (5%)

Percent canopy (shrub) – 32% (39%)

Percent canopy (herb) – 6% (9%)

Average Imprint – Quadrats E, F, G H

Percent basil cover (shrubs) – 24% (24%)

Percent basil cover (herbs) – 11% (11%)

Percent bare ground – 43% (43%)

Percent rock or other – 8% (8%)

Percent canopy (shrub) – 32% (36%)

Percent canopy (herb) – 17% (20%)

Average Hand Broadcast – Quadrats I, J, K L (average)

Percent basil cover (shrubs) – 26% (26%)

Percent basil cover (herbs) – 23% (23%)

Percent bare ground – 18% (18%)

Percent rock or other – 3% (3%)

Percent canopy (shrub) – 39% (46%)

Percent canopy (herb) – 18% (24%)

Point Intercept:

The representation of each species within a quadrat was estimated by broad cover classes (<1%, 1-5%, 5-25%, 25-50%, 50-75% and >75%). The percent cover of each species based on the point intercept method is as follows:

Hydroseed– Quadrats A, B, C, D (average)

| Species | % Cover Shrub | % Cover Herb |
|---------------------------------|----------------------|---------------------|
| Acmispon glaber | | |
| Adenostema fasciculatum | | |
| Achillia mellifolium | | |
| Artemisia californica | 1% | |
| Atriplex lentiformis | 11% | |
| Atriplex polycarpa | 15% | |
| Atriplex spinosa | 1% | |
| Baccharis pilularis | | |

| Hirshfeldia incana | | 5% |
| Vulpia microstachys | | |
| Salsola kali | | 1% |
| Bromus sp. | | 12% |

DISCUSSION

There was not a substantial change in the density or richness of species within the pilot study area compared to the 1st quarter monitoring period of 2018. It appears that weed control has not been conducted, and most weedy species have set seed and senesced. Most notably, mats of senesced dense brome grass (*Bromus sp.*) have developed in several of the quadrats, including an increase of mustard (*Hershfeldia incana*). If seasonal rainfall is near average, it should be expected that there will be a high germination rate of non-native species throughout the pilot study site. As depicted in several of the photos (attached), *Atriplex lentiformis* has the highest amount of seedlings throughout the pilot study area and is of highest concentration.

Quadrats H, I and L have the greatest amount of relative cover, mostly comprised of *A. lentiformis* and *A. polycarpa*, because these plots are located at a low, relatively flat portion of the pilot study area, where water

generally accumulates after rain events. The hand broadcast seeding method has the highest percentage of shrub canopy cover (i.e., *A. lentiformis*) compared to hydroseed and imprint seeding methods. That said, the northwest portion of the hand broadcast area (quadrats I and J) is at a low-point compared to the rest of the pilot study area, and as indicated above, water tends to pool in this area and therefore it has the greatest density of vegetation compared to other portions of the pilot study area. As noted in past monitoring reports, both the quadrat method and the point intercept method confirm that *A. lentiformis* has the highest relative cover of all plant species in the pilot study site, with *A. polycarpa* as a co-dominant. The qualitative monitoring results also confirm that these species are of highest abundance. Selective thinning of *Atriplex* in select areas will create openings and opportunities for natural recruitment and establishment of other native shrub species. Photographs of each quadrat are provided on the following pages, as well as the raw data obtained within each quadrat sampled.
