

November 4, 2020

Mr. Martins Aiyetiwa, P.E.  
Senior Civil Engineer  
County of Los Angeles, Department of Public Works  
900 South Fremont Avenue  
Alhambra, CA 91803-1331

Subject: Sunshine Canyon Landfill, Quarterly Vegetation Report  
Third Quarter 2020 Vegetation Report

Mr. Aiyetiwa,

This report has been prepared in accordance with the following:

- Condition 18B of the Finding of Conformance;
- Condition 44A of the Condition Use Permit (CUP)
- Los Angeles City Condition [Q] C.8 of the Ordinance No. 172,933.

This report presents the progress of the site's landscaping and revegetation activities for the third quarter of 2020. The intent of these reports is to provide detailed information regarding the site's efforts related to vegetation including vegetation of interim and permanent slopes and activities conducted for the on-site sage mitigation areas.

Architerra Design Group continues to assist site personnel in evaluating current site conditions relating to vegetation and provide recommendations for future efforts. This report includes their assessment of the pilot sage vegetation area as well as recommendations for this area. Architerra's evaluation is in addition to the required quarterly monitoring performed by our consulting biologist.

## 1.0 Interim Slopes

For the purposes of this report, interim slopes are those defined as slope areas where no activities have taken place for 180 days or longer. CUP Condition 44A requires "a temporary hydroseed vegetation cover on any slope or landfill area that is projected to be inactive for a period of greater than 180 days".

## 1.1 Hydroseeding Activities

Based on the results of the trial project completed in August 2017, a 57-acre vegetative cover project using the approved seed mix was completed in mid-December 2017. Additionally, the site completed hydroseeding approximately 155 acres; application of the approved seed mix was completed during 2019. The increase in hydroseeding application is a result of our normal winterization efforts along with slope revegetation as a result of the Saddle Ridge Fire that impacted Sylmar, CA on October 2019. These areas had successful vegetation growth after the recent rains.

## 2.0 Permanent Slopes

Permanent slopes are defined as those where no landfilling activities will be conducted in the future.

As part of our Saddle Ridge Fire recovery efforts both the City and County permanent slopes of the landfill had hydroseed applied as necessary. This application of hydroseed was completed for soil stabilization purposes.

## 3.0 Non-Permanent Cut Slopes

Prior quarterly vegetation reports have illustrated one area above the front terminal sedimentation basin and one area near the temporary bypass road as “non-permanent cut slopes”. An evaluation of these areas has been conducted and it has been determined that these areas are “permanent slopes” because no landfilling activities will be conducted against these slopes in the future.

## 4.0 Activities Conducted in Sage Mitigation Areas – 3Q2020

During the third quarter of 2020, the following activities were conducted in the sage mitigation areas at the landfill.

### 4.1 City South Sage Pilot Project Area – Deck C

The lower Deck C mitigation project area was impacted by the Saddle Ridge fire in October 2019. As noted in JMA’s City-Side Sage Mitigation Area Lower Deck report a substantial amount of the lower deck was burned or scorched. However, in previous reports they note that because this was an established site, they expect natural re-establishment of the native vegetation within the first two to three years. JMA has noted a substantial amount of regrowth has occurred following the fire and included the most prevalent natives such as

California Sunflower, Saltbush, Horsetweed, and pockets of Wild Ryegrass. JMA also indicated the intense weeding efforts implemented has greatly reduced the cover of the noxious non-native annual species.

During their most recent visit, Architerra Design Group indicates that there has been an abundance of Venturan CSS species germinating and crown-sprouting since the fire. The species following the rebound include Purple Sage, Coast Sunflower, White Sage, Creeping Wild Rye, Deerweed, Black Sage, and Mexican Elderberry. Surprisingly there are also new species from the original seed mix are now sprouting up in decent numbers and are Scarlet Bugler, Telegraph Weed, Monkey Flower and Smooth-Leaf Yerba Santa and now the VCSS is going through dormancy.

#### 4.2 City South Deck B

The Deck B sage mitigation project began on April 9, 2018 and planting was completed by the end of the fourth quarter 2018. Soil samples indicated low pH and high salinity, as a result Deck B underwent a leaching schedule. Additional soil amendments and resampling were completed before planting began, which took place during the fourth quarter 2018. Pacific Restoration Group, Inc (PRG) has been working with Architerra for the completion of project. A summary of the progress is included in Attachment 3. The northwest portion of the Middle Deck burned during the Saddle Ridge Fire in October 2019. Architerra Design Group indicates Deck B is doing quite well and there is evidence of desiccation of the seedlings especially the Common Yarrow and other native species that have recently spouted and are beginning to harden off and defoliate. Architerra have indicated the plant diversity on Deck B is impressive and many of the species in the seed mix have germinated and the containerized plants also are doing well and are blooming or just finished which are the White Sage, Mexican Elderberry, Menzie's Goldenbush, and Prickly Pear.

JMA has noted a large amount of sage scrub has resprouted and some of which are flowered this past Spring following the damage from the fire. JMA has mentioned the weed cover is generally low-to-moderate and most annual species are currently dormant or have desiccated.

#### 4.3 County Sage Mitigation Area

The County sage mitigation area is located on the western side of the County portion of Sunshine Canyon Landfill (Drawing 1). As noted in the fourth quarter JMA County-Side Sage Mitigation Area report the upper half of the mitigation site was burned in the Saddle Ridge fire in October of 2019. No revegetation activities were conducted in this area during the third quarter of 2020, and as noted in multiple JMA progress reports, the conditions in this mitigation area have remained unchanged for some time. JMA notes in their attached 2020 third quarter vegetation report that this area remains problematic for establishment of vegetation. Soil samples from this location indicate low pH, high salinity, and Boron present in native soils.

## 5.0 Assessments of Sage Mitigation Areas

Assessments of the site's sage mitigation areas are conducted by a qualified biologist on a quarterly basis. The following sections present a summary of the recommendations for the sage mitigation areas from JMA (City and County sage mitigation areas) and Architerra (City South Sage Pilot Project Area (Deck C) and Middle Deck (Deck B) and the proposed actions in response to the recommendations.

### 5.1 JMA Recommendations for City Sage Mitigation Areas

JMA's progress reports for the City Sage Mitigation Areas for the third quarter of 2020 are provided in Attachment 1. These reports include recommendations based on the assessments. Table 1 presents a summary of these recommendations and the proposed actions.

**Table 1 – JMA Recommendations and Proposed Actions – City Sage Mitigation Areas, Third Quarter 2020**

AREA		RECOMMENDATION	PROPOSED ACTION
Lower, Middle, and Upper Decks (Decks C, B, and A)	1	Weed Control – Implement a year-round weed control program to control non-native species.	A weed control program is already in place on Deck C and B as part of the pilot project and will continue. A weed control program on A will be implemented along with the mitigation plans for these areas.
Lower, Middle, and Upper Decks (Decks C, B, and A)	2	Prohibit Access – Continue to prohibit vehicle access to mitigation areas.	Repairs to the T-post fencing will be made as needed.

Upper Deck (Deck A)	3	Improve root zone and soil conditions	This will be addressed when the plans for Deck A is developed. Actions were taken to address improving the root zone in Decks B & C; it is expected that similar actions will be incorporated into the plans for Deck A.
Upper Deck (Deck A)	4	Plant natives in areas dominated with non-natives	This will be addressed when the plans for Deck A are developed. Various planting methods were used for the construction of the pilot project on Decks B & C; it is expected that similar actions will be incorporated into the plans for Deck A.
Upper Deck (Deck A)	5	Reseeding – apply native seeds during the rainy season after soil mounds have been established	This will be addressed when plans for Deck A are developed

JMA also recommended that a monitoring biologist should be present during weed control activities or the native plants should be flagged to ensure only non-native species are removed. A monitoring biologist will be consulted prior to any weed control activities to ensure native plants are protected.

Architerra continues to provide support to the Oakridge maintenance personnel to assist in removal of the invasive weeds on both Deck B and C. Architerra has pointed out some of the more aggressive weeds that have flourished since the Saddle Ridge Fire. Architerra provided them with images of the invasive weeds to help identify and target these invasive species. PRG and Oakridge Landscape have been diligently removing Russian Thistle, Wild Oat, Shortpod Mustard, Red Brome Grass, False Barley, Tree Tobabcco, and Yellow Star Thistle that took hold in the burned barren areas.

## 5.2 JMA Recommendations for County Sage Mitigation Area

Table 2 presents a summary of the recommendations proposed by JMA based on the assessment of the County Sage Mitigation Area and the proposed actions. Please refer to the full recommendations in the JMA reports in Attachment 2.

**Table 2 – JMA Recommendations and Proposed Actions – County Sage Mitigation Area, Second Quarter 2020**

AREA	RECOMMENDATION		PROPOSED ACTION
County Sage Mitigation Area	1	Create benches to control soil erosion and improve soil conditions to improve plant establishment and seed dispersal	This recommendation will be considered at a later date.
County Sage Mitigation Area	2	Reseed and plant container plants	This recommendation will be considered at a later date.
County Sage Mitigation Area	3	Plant within view sheds	This recommendation will be considered at a later date.
County Sage Mitigation Area	4	Use soil amendments	This recommendation will be considered at a later date.
County Sage Mitigation Area	5	Signage – Install signage indicating revegetation efforts.	Due to the slopes, stormwater channel and overall difficulty to access this area, personnel are limited to access this area.
County Sage Mitigation Area	6	Weed Control – Continue weeding as needed on a quarterly basis.	Personnel continues to evaluate the current status.
County Sage Mitigation Area	7	Prohibit Access – continue to prohibit vehicle access to mitigation deck.	This is currently being done, no further effort is planned in the near future.
County Sage Mitigation Area	8	Employee Awareness – conduct employee awareness training.	This is currently being done as part of our Environmental Communication efforts.

**5.3 Architerra Inspection for City South Sage Mitigation Pilot Project Area – Third Quarter 2020**

The inspection report is included in Attachment 3 along with photos of the area taken at the photo stations.

**5.4 Quarterly Assessment of City South Sage Pilot Project Area**

The methodology for assessment of the City South Sage Pilot Project Area developed by JMA was included in the first quarter 2015 Vegetation Report. The evaluation report for the third quarter of 2020 based on this methodology is included in Attachment 4 and Attachment 5 for Deck C and Deck B, respectively.

#### 6.0 Status of Other Vegetated Areas

##### Big Cone Douglas Fir Tree Mitigation

As reported in the vegetation report for the first quarter of 2015, 200 Big Cone Douglas fir tree saplings were planted the third week of March 2015. These trees continue to be monitored and maintenance activities will be conducted in this mitigation area for the remainder of 2020 and into the future.

Please do not hesitate to contact me at (818) 362-2096 if you have any questions.

Sincerely,

Tuong-Phu Ngo, P.E.  
Environmental Manager

# SUNSHINE CANYON LANDFILL MITIGATION SITES

## Progress Report

### City-Side Sage Mitigation Area

<b>Submittal Date:</b> October 30, 2020		<b>Inspection Date:</b> October 5, 2020	
<b>To:</b> Tuong-phu Ngo, Environmental Manager		<b>From:</b> Greg Ainsworth, Monitoring Biologist <i>*Prepared on behalf of Republic Services</i>	
<b>Lower Deck</b>			
<b>General Comments:</b> The lower deck (Deck C) and surrounding area burned during the Saddleridge Fire in October, 2019. The fire burned a substantial amount of the lower deck, scorching some of the vegetation entirely and partially burning some of the vegetation. The irrigation within the lower deck also burned in the fire, as did the stakes that marked the corners of the test plots. However, all of the test plots have since been re-staked and are now recognizable. A substantial amount of regrowth has occurred following the fire. The most prevalent natives currently observed within Deck C is California sunflower ( <i>Encelia californica</i> ) and saltbush ( <i>Atriplex sp.</i> ), as well as horseweed ( <i>Erigeron canadensis</i> ) and pockets of wild ryegrass ( <i>Leymus triticoides</i> ) that are currently senesced. As reported during the Q2 monitoring period, dense mats of non-native brome grasses ( <i>Bromus sp.</i> ) and foxtail barley ( <i>Hordeum jubatum</i> ) were prevalent throughout Deck C, as well as large stands of shortpod mustard ( <i>Hirschfeldia incana</i> ); however, weeding efforts implemented by the landfill has greatly reduced the cover of these noxious non-native annual species.			
<b>Native Plant Cover:</b> <input type="checkbox"/> Dense <input type="checkbox"/> Moderate <input checked="" type="checkbox"/> Minimal	<b>Plant Health Issues:</b> <input type="checkbox"/> Disease/pests <input type="checkbox"/> Plant stress <input type="checkbox"/> Herbivory <input checked="" type="checkbox"/> Fire	<b>Height of Native Species:</b> <input type="checkbox"/> 0" – 12" <input type="checkbox"/> 12" – 24" <input checked="" type="checkbox"/> 24" and above	<b>Native Species Richness:</b> <input checked="" type="checkbox"/> Low <input type="checkbox"/> Medium <input type="checkbox"/> High
<b>Weed Conditions</b>			
<input type="checkbox"/> Dense weed coverage <input type="checkbox"/> Moderate weed coverage (seeding in high density) <input checked="" type="checkbox"/> Minimal weed coverage		<input type="checkbox"/> Weeds germinating /vegetative growth <input type="checkbox"/> Weeds flowering <input type="checkbox"/> Weeds setting seed <input checked="" type="checkbox"/> Weed desiccant/dormant	
<b>Comments:</b> Overall weed growth is low due to ongoing g weeding efforts. Weeds that were present are currently generally senesced.			
<b>Middle Deck</b>			
<b>General Comments:</b>			

26623 Sierra Vista  
Mission Viejo, CA 92692  
949-367-1000  
[www.jma-ca.com](http://www.jma-ca.com)

<p>The northwest portion of the Middle Deck burned during the October Saddleridge Fire. Other areas of the Middle Deck that did not burn in the fire generally appear dry, with minimum grasses present. The irrigation at the Middle Deck may have burned during the fire. Approximately 35% of the vegetation that was previously planted was dominated by sage scrub plantings/seedlings and 30% by non-native grasses; however, a substantial amount of this previously planted portion of the Middle Deck completely burned in the fire. Approximately 40% of the Middle Deck area was planted in the winter/spring of 2019 with native species</p>			
<b>Native Plant Cover:</b> <input type="checkbox"/> Dense <input type="checkbox"/> Moderate <input checked="" type="checkbox"/> Minimal	<b>Plant Health Issues:</b> <input type="checkbox"/> Disease/pests <input type="checkbox"/> Plant stress <input type="checkbox"/> Excessive herbivory <input checked="" type="checkbox"/> Fire	<b>Height of Species:</b> <input type="checkbox"/> 0" – 12" <input type="checkbox"/> 12" – 24" <input checked="" type="checkbox"/> 24" and above	<b>Native Species Richness:</b> <input checked="" type="checkbox"/> Low <input type="checkbox"/> Medium <input type="checkbox"/> High
<b>Weed Conditions</b>			
<input type="checkbox"/> Dense weed coverage <input checked="" type="checkbox"/> Moderate weed coverage (seeding in high density) <input checked="" type="checkbox"/> Minimal weed coverage		<input type="checkbox"/> Weeds germinating /vegetative growth <input type="checkbox"/> Weeds flowering <input type="checkbox"/> Weeds setting seed <input type="checkbox"/> Weed desiccant/dormant	
<b>Comments:</b> A minimal amount of (living) non-native weeds were noted within the middle deck.			
<b>UPPER DECK</b>			
<p><b>General Comments:</b> The southern half of the Upper Deck was burned by the Saddleridge Fire. Overall, the upper deck continues to be sparsely covered with native vegetation, and total vegetation coverage is sparse due to compacted and poor soil conditions. Specifically, the soils to the north of the central access road are heavily compacted and gravelly and vegetation coverage in this area is especially sparse. Evidence of previous seeding is no longer discernible.</p> <p>Desiccated wild oats (<i>Avena fatua</i>), brome grasses and mustard (<i>Brassica nigra</i>) generally dominate the non-native cover throughout the Upper Deck, along with various patches of Russian thistle (<i>Kali tragus</i>). Buckwheat is the dominant native plant that is present; however, overall natural recruitment within the Upper Deck is low due to poor soil conditions and a dry soil conditions.</p>			
<b>Native Plant Cover:</b> <input type="checkbox"/> Dense <input type="checkbox"/> Moderate <input checked="" type="checkbox"/> Minimal	<b>Plant Health Issues:</b> <input type="checkbox"/> Disease/pests <input type="checkbox"/> Plant stress <input type="checkbox"/> Excessive herbivory	<b>Height of Species:</b> <input type="checkbox"/> 0" – 12" <input type="checkbox"/> 12" – 24" <input checked="" type="checkbox"/> 24" and above	<b>Native Species Richness:</b> <input checked="" type="checkbox"/> Low <input type="checkbox"/> Medium <input type="checkbox"/> High
<b>Weed Conditions</b>			
<input type="checkbox"/> Dense weed coverage <input checked="" type="checkbox"/> Moderate weed coverage (seeding in high density) <input type="checkbox"/> Minimal weed coverage		<input checked="" type="checkbox"/> Weeds germinating /vegetative growth <input checked="" type="checkbox"/> Weeds flowering <input type="checkbox"/> Weeds setting seed <input type="checkbox"/> Weed desiccant/dormant

Mission Viejo, CA 92692  
949-367-1000  
[www.jma-ca.com](http://www.jma-ca.com)

**Comments:** Weeds continue to grow without any level of control within the Upper Deck. Wild oats, brome grasses, mustard and Russian thistle are currently dominant and appear to be denser than noted during prior monitoring events.

## RECOMMENDATIONS

### Lower and Middle Decks

- **Weed control.** Implement a year-round weed control program to control non-native species. The weed control program should incorporate both chemical and mechanical control practices. Following weed control, any dead material harboring seeds should be removed to an off-site location to the extent feasible.

A monitoring biologist should be present during weed control activities or flag the native plants that should remain to ensure only non-native species are removed. A biologist should verify that the weed removal methodology is sound and does not encourage re-colonizing of non-natives. Weeding is best performed just before, or at the onset of flowering, but before seed set. If seeds are already present, additional care should be taken to remove the plants with the seeds attached, or the seeds should be removed from the plants prior to the plant removal. A consistent weed abatement schedule will reduce the potential for non-natives to set seed. Soil disturbance should be limited by hand weeding, where possible, and weeds should be disposed of off-site to avoid any reinfestation through reseeding or from plant propagules. If hand weeding is not possible, the monitoring biologist should be consulted regarding the appropriate method of weed removal. If there continues to be high incidence of weed infestation, weed control may need to be increased to every four to six weeks. Otherwise, weeds should continue to be monitored and controlled on a quarterly basis.

- **Prohibit access.** Continue to prohibit vehicle access to mitigation areas.

### Upper Deck

- **Improve root zone and soil conditions.** Continue to investigate ways to import the soil layer to improve the root penetration and saturation zone to enable plant growth in heavily compacted areas. Consider applying soil in random undulations or uneven mounds to improve soil porosity and filtration and to control soluble salts from leaching from existing layer.

If permissible, prior to seeding (broadcast, hydroseeding, or drilling) native species, incorporate a soil amendment or mulch with high organic content by tilling into the top 12 inches of the existing compacted soils to improve soil texture, drainage, porosity, and aerobic conditions. If an organic mulch or soil amendment is not feasible or available, incorporate available soil from on-borrow sites within the landfill that have the appropriate, so long as these borrowed soils have been determined to not have toxic conditions such as boron or high salinity.

- **Plant natives in areas dominated with non-natives.** The vegetated areas on the middle deck that are currently dominated with annual, non-native species have decent soil-texture conditions. These areas are not near as compacted as adjacent areas that are gravelly and mostly void of

26623 Sierra Vista  
Mission Viejo, CA 92692  
949-367-1000  
[www.jma-ca.com](http://www.jma-ca.com)

vegetation. In general, the soil texture within the vegetated areas with non-native vegetation is friable down to approximately 8-12 inches in depth. Various planting methods (i.e., planting container plants and hydroseeding) may be used to re-establish native plants on the middle and upper decks where non-natives currently dominate.

- **Weed control.** Implement a year-round weed control program to control non-native species. The weed control program should incorporate both chemical and mechanical control practices. Following weed control, any dead material harboring seeds should be removed to an off-site location to the extent feasible.

A monitoring biologist should be present during weed control activities or flag the native plants that should remain to ensure only non-native species are removed. A biologist should verify that the weed removal methodology is sound and does not encourage re-colonizing of non-natives. Weeding is best performed just before, or at the onset of flowering, but before seed set. If seeds are already present, additional care should be taken to remove the plants with the seeds attached, or the seeds should be removed from the plants prior to the plant removal. A consistent weed abatement schedule will reduce the potential for non-natives to set seed. Soil disturbance should be limited by hand weeding, where possible, and weeds should be disposed of off-site to avoid any reinfestation through reseeding or from plant propagules. If hand weeding is not possible, the monitoring biologist should be consulted regarding the appropriate method of weed removal. If there continues to be high incidence of weed infestation, weed control may need to be increased to every four to six weeks. Otherwise, weeds should continue to be monitored and controlled on a quarterly basis.

- **Reseeding.** Following the application of soil mounds as previously described, apply native seed (by means of broadcast seeding, hydroseeding or drilling) during the rainy season, between December and March, or prior to a forecasted rain event.

- **Prohibit access.** Continue to prohibit vehicle access to mitigation areas.

# SUNSHINE CANYON LANDFILL MITIGATION SITES

## Progress Report

### County-Side Sage Mitigation Area

<b>Submittal Date:</b> October 30, 2020	<b>Inspection Date:</b> October 5, 2020
<b>To:</b> Tuong-phu Ngo, Environmental Manager	<b>From:</b> Greg Ainsworth, Monitoring Biologist <i>*Prepared on behalf of Republic Services</i>
<b>STATUS OF HYDROSEEDING</b>	
<b>Conditions:</b> <input type="checkbox"/> Fully covered <input type="checkbox"/> Moderately covered <input checked="" type="checkbox"/> Barely covered	
<b>Comments:</b> Conditions on the county-side sage mitigation area remain relatively unchanged. Areas that are moderately covered with native and non-native vegetation are concentrated. A substantial portion of the county-side mitigation area continues to be bare and problematic for establishment of vegetation, primarily because of highly eroded soils, steep slopes and Boron-toxic soils (See Recommendations).  Native plant coverage is similar to the previous quarterly monitoring reports. The southern-half of the mitigation area contains the most vegetation, which consists of the highest concentration of native species, mostly California buckwheat ( <i>Eriogonum fasciculatum</i> ) and California sunflower ( <i>Encelia californica</i> ). Native plant coverage is assumed to be a direct result of hydroseeding; however, some natural recruitment is apparent that consists mostly of California sunflower seedlings. Due to rocky (hydrophobic) soil conditions, soil erosion and Boron-toxic soils on the northern-half of the county-side mitigation area, a minimal amount of plant growth is present.	
<b>SEED MIX</b>	
<b>Conditions:</b> <input type="checkbox"/> No sign of germination <input type="checkbox"/> No cover of native plants from seed mix <input type="checkbox"/> Sparse cover of native plants from seed mix	<input type="checkbox"/> Dense cover of native plants from seed mix <input checked="" type="checkbox"/> Moderate cover of native plants from seed mix (where vegetation is present)
<b>Comments:</b> Similar to the hydroseeded areas, the other areas that are moderately covered with vegetation are concentrated. A substantial portion of the county-side mitigation area continues to be bare and problematic for vegetation to become established. However, in areas where vegetation is present, there is a moderate coverage of native species, mostly California buckwheat and California sunflower.	

26623 Sierra Vista  
Mission Viejo, CA 92692  
949-367-1000  
[www.jma-ca.com](http://www.jma-ca.com)

Germination and plant growth from hydroseeding or seed mix is not discernible. As reported in previous monitoring reports, a moderate cover of native plants exists within vegetated areas. Annual non-native grasses and forbs currently dominate the ground cover in most of the vegetated areas. Senesced brome grasses (*Bromus sp.*), wild oats (*Avena fatua*) and shortpod mustard (*Hirschfeldia incana*) currently comprise approximately 25 percent of the absolute plant cover. California buckwheat dominates the native vegetation coverage with California sagebrush and California sunflower (*Encelia californica*) as co-dominants. These native species comprise of approximately 75 percent of the native vegetation cover in areas where vegetation is present. Other less dominant native species observed include golden bush (*Ericameria linearifolia*), coyote brush (*Baccharis pilularis*), black sage (*Salvia millifera*) and laurel sumac (*Malosma laurina*).

### OVERALL NATIVE PLANT CONDITIONS

<b>Plant Cover:</b> [ ] Dense [ ] Moderate [X] Minimal	<b>Plant Health Issues:</b> [ ] Disease/pests [ ] Plant stress [ ] Excessive herbivory [X] Fire	<b>Height:</b> [ ] 0" – 12" [X] 12" – 24" [ ] 24" and above	<b>Species Richness:</b> [ ] Low [X] Medium [ ] High
---	---	--	---

### Comments:

It should be noted that the plant cover rating above applies where vegetation is dominant in the southeastern portion of the mitigation area. Vegetation cover is moderate in the southeastern portion of the county-sage mitigation area; whereas it is sparse along the upper slopes where rocky conditions occur. Bare areas and non-native annual grasses are intermixed in the lower areas where vegetation has established. Native vegetation coverage is good in vegetated areas and the amount of non-native grasses that is present is normal when compared to sparsely covered areas of California buckwheat in the region.

As indicated previously, California buckwheat dominates the native cover with *Encelia californica* as a co-dominant. Establishment of vegetation is problematic due to rocky soils with poor soil structure, and boron toxicity has suppressed recruitment of native species (i.e., seed germination and recruitment). The species richness is moderate within vegetated areas; however, species richness is considerably low when considering the entire county-sage mitigation area.

### WEED CONDITIONS

<b>Conditions:</b> [ ] Dense weed coverage [X] Moderate weed coverage (seeding in high density) [ ] Minimal weed coverage	[ ] Weeds germinating [ ] Weeds flowering [ ] Weeds setting seed [X] Weed desiccant/dormant
--	--

### Comments:

Annual, non-native weed species consist primarily of senesced brome grasses and wild oats, as well as patches of senesced short-pod mustard. Other established weeds that were observed include red-stemmed filaree (*Erodium cicutarium*) and (native) telegraph weed (*Heterotheca*

26623 Sierra Vista  
Mission Viejo, CA 92692  
949-367-1000  
[www.jma-ca.com](http://www.jma-ca.com)

*grandiflora*) that are currently senesced. Russian thistle (*Salsola kali*) are scattered within the vegetated areas, but in less densities than the other non-native species noted above.

### MISCELLANEOUS

**Conditions:**☐ Trash☐ Vandalism☐ Erosion**Comments:**

None

### RECOMMENDATIONS

- **Create benches.** Consider creation of benches throughout the mitigation area to control soil erosion and to improve soil conditions to improve plant establishment and seed dispersal. This technique has been widely used on steep slopes and in areas where soil erosion is problematic. This technique also allows for opportunities to introduce a high quality soil layer above the poor soils that exist.
- **Reseed and plant container plants.** If creation of benches is feasible, planting methods should include Hydroseeding and broadcast seeding just before a forecasted rain event and planting with container plants with supplemental irrigation during the period of establishment. Container plants should only be planted if temporary irrigation source is available.
- **Plant within view sheds.** Consider planting native species on upper portion of the slope that is visible from public view sheds with appropriate native species. Planting should occur prior to fall/winter rains.
- **Use soil amendments.** Incorporate a soil amendment or mulch with high organic content in select areas as determined by a restoration specialist.
- **Signage.** Install signs indicating that the area is undergoing revegetation.
- **Weed control.** Continue weed control program as needed on a quarterly basis.
- **Prohibit access.** Continue to prohibit vehicle access to mitigation area. Extend fencing around southeastern and southern boundary of lower deck and review fencing on the upper deck to determine if additional area can be reasonably enclosed.
- **Employee awareness.** Conduct an employee awareness program to inform staff on the importance of preserving all restoration areas.

**FIELD OBSERVATION REPORT**

DATE OF VISIT:	09/29/20
<b>PROJECT:</b>	<b>Sunshine Canyon Mitigation Sites</b>
PROJECT NUMBER:	1214
PROJECT MANAGER:	Gregg Denson
SITE INSPECTION #:	
PURPOSE OF VISIT:	Review site conditions/Photo Catalog
TIME OF SITE VISIT:	10:30am
WEATHER/TEMPERATURE:	Sunny and Hot 98°
ESTIMATED % COMPLETED:	100%
CONFORMANCE WITH SCHEDULE (+, -)	

WORK IN PROGRESS:	Weed abatement / Monitoring Period /Construction Observation
PRESENT ON SITE:	Gregg Denson

A site visit walk and evaluation has been completed to review the Venturan CSS vegetation establishment on the Trial Site (Deck C), Deck B and County Mitigation Slopes. Additional items noted during the site visit are as follows:

**City-Side Sage Mitigation (Trial Site Deck C):**

- It has now been a year since the Saddleridge Fire broke out and destroyed much of the vegetation and irrigation on Decks B and C. When reviewing the set photo stations and looking back on the comparison from 2019, it is obvious that the revegetation and crown sprouting of the existing vegetation has not yet met the density of the pre-fire conditions. However, it is evident that the process is underway, and the vegetation has rebounded with success in many of the areas. The biggest challenge to date continues to be the fight to rid the decks of persistent invasive weeds.
- Oakridge Landscape maintenance personnel have been diligently removing weeds and clearing the decks where needed, but weeding efforts will need to continue until the native plant vegetation is able to close the canopy again. In addition, surrounding areas not within the Trial Sites should be managed as well so that weed seed is limited and does not easily find it's way onto the decks via wind or runoff. During the late summer months, Russian Thistle (*Salsola* spp.) is actively growing and the decks need to be removed of it as quickly as possible since it is reaching maturing and currently blooming. There are also some large stands of Yellow Star Thistle (*Centaurea solstitialis*) that have not been removed. This may be due to the challenge of identifying the difference between the Yellow Star Thistle and the dormant Coast Sunflower (*Encelia californica*). There are also some Sprangletop Grasses (*Leptochloa* sp.) now growing and flowering within the swale areas as well as Stinkwort Weed (*Dittrichia graveolens*) that should be removed immediately prior to setting seed.

Side by Side - Native Plant Coast Sunflower (Summer dormant on Left) and Invasive Weed Yellow Star Thistle (Summer dormant on Right)

Mature and flowering Russian Thistle (*Salsola* spp.)

Up close Russian Thistle (*Salsola* spp.) showing flowering

Younger Russian Thistle actively growing

Adjacent slopes with dormant Short Pod Mustard, Yellow Star Thistle and Horse Weed

Groundcover Acacia (*Acacia redolens*) a non-native shrub growing on deck

Stinkwort Weed (*Dittrichia graveolens*)

Sprangletop Grasses (*Leptochloa* sp.)

Mature and flowering Telegraph Weed (*Heterotheca grandiflora*)

Dormant California Sagebrush (*Artemisia californica*)

Deerweed (*Acmispon glaber*) growing in the understory of burned Saltbush

Scale Broom (*Lepidospartum squamatum*) growing under burned Saltbush

California Sunflower (*Helianthus californicus*)

Juvenile Big Saltbush (*Atriplex lentiformis*) left, and Smooth-Leaf Yerba Santa (*Eriodictyon trichocalyx*) right

Juvenile Black Sage (*Salvia mellifera*) left and California Sagebrush (*Artemesia californica*) right

Existing burned Coast Live Oak at the PM10 Berm

Minimal crown sprouting at base of Coast Live Oak tree  
Some of the Oak Trees are not rebounding as well as others that were damaged by fire.

New Laurel Sumac (*Malosma laurina*) front and Black Sage (*Salvia mellifera*) at burned portion of Deck C

#### **City-Side Sage Mitigation (Trial Site Deck B):**

- Even though a good portion of this deck was burned by the Saddleridge Fire, many of the VCSS natives that were previously established have quickly resprouted and have flourished during the past spring and summer months. Weeding efforts have dramatically improved since the last reporting and the abundant weed growth within the central portion of the native stand of Venturan Coastal Sage Scrub has been removed to allow for new growth of the recently germinated native species. Areas surrounding the Trial Site have been cleaned up, including the areas near the heli-pads, however, there is still an abundance of weed growth to the east and along the lower slope areas between Decks B and C.
- The temporary irrigation mainline, valves and laterals were significantly damaged during the firefighting efforts last October. Although the irrigation is inoperable at this time, it is our opinion that additional supplemental irrigation may not be needed within the trial site of Deck B. ADG suggests that the existing VCSS plant community germination and establishment be evaluated in the 2<sup>nd</sup> Quarter Reporting of 202, once the 2020-2021 winter/spring precipitation has ended.

- The quadrats on Deck B were restaked in this last quarter as many were burned or damaged during the Saddleridge Fire. Photo Stations have also been restaked and baseline photo images are provided from each of the eight (8) photo stations
- There are still areas of this trail site that are open and accessible by vehicles. The perimeter should be restaked with the T-Bar staking to restrict access onto these deck areas.

Current view east illustrating removed weeds within VCSS area that was burned

View of same area from June 2020

Newly staked quadrats that were previously burned

Open access into trail area on west side where staking is missing and knocked down

Open access into trail area on east side where staking is missing

Evidence of continued vehicle traffic onto the deck

Existing VCSS on Deck B, recently weeded and cleaned

Blooming Sawtooth Goldenbush (*Hazardia squarrosa*)

**subject** Coastal Sage Scrub City South C Trial Plot Monitoring Report, Sunshine Canyon Landfill – 3<sup>rd</sup> Quarter, 2020

---

## INTRODUCTION

The majority of the Landfill's City South 'C' Trial Plot area, also referred to as Deck C, substantially burned during the Saddleridge Fire in October 2019. Most of the stakes that marked to corners of the sampling plots (i.e., quadrats) were removed by fire equipment and personnel or were burned from the fire; however, the sample plots have since been re-staked all of the plots are now recognizable. With the exception of quadrats A, B E, F and G, the remainder of the quadrats burned extensively during the fire, but have since recovered to some degree with successional species, predominantly horseweed (*Erigeron canadensis*) and non-native annual grasses, including bromes (*Bromus sp.*) and foxtail barley (*Hordeum jubatum*). The previous monitoring period conducted for the 2<sup>nd</sup> quarter revealed that there was an extensive amount of non-native grasses that had formed dense mats; however, intensive weed control has since been implemented by the landfill that has removed a large amount of these noxious weeds, including stands of short-podded mustard (*Hirschfeldia incana*). What remains now is mostly bare ground where these non-native previously dominated with patches of native species that are greater in the northeastern portion of the City South C Trial Plot area.

On October 6, 2020, biologist Greg Ainsworth monitored the coastal sage scrub revegetation area at the Landfill's City South 'C' Trial Plot, which constitutes the 3<sup>rd</sup> quarter monitoring of the Deck C trial plot for 2020. The sample methodology generally followed the *Methodology for Monitoring Percent Cover and Species Richness within Each Seeded Application Method on the Coastal Sage Scrub Pilot Project at the Sunshine Canyon Landfill* (JMA, April 23, 2014). Quadrat sampling of the sage pilot study area consists of four, 50-meter quadrats that are randomly sampled within each of the following three seeded areas: hydroseed, imprint and hand broadcast. The quadrats were randomly selected prior to the first initial monitoring event from a grid that was placed over the entire trial plot, and each quadrat is delineated in the field with wooden stakes. As shown on the attached planting plan, each quadrat that was sampled was given a corresponding letter from A-L.

A total of 200 meters were sampled for each of the three seeded areas and the following data was collected in each quadrat that was sampled:

- **Percent basil cover (shrubs)** –Visual estimate of the amount of basil cover within each quadrat for all shrub species.

- **Percent basil cover (herbs)** – Visual estimate of the amount of basil cover within each quadrat for all herb species.
- **Percent bare ground** – Visual estimate of the amount of available bare ground with no vegetation, but suitable for plant growth.
- **Percent rock or other** – Visual estimate of the amount of unavailable ground for supporting plant growth. Inhibitors generally included rocks and boulders, irrigation lines and valve boxes, and mulch.
- **Percent canopy** – Visual estimate of the percent canopy of each shrub and herbaceous species.
- **Photographs** – A photograph was taken from the southwest corner (facing northeast) of each quadrat.

To obtain estimate cover of each species, the point intercept method was used which consisted of data collection points every 0.5 meter along the perimeter of each quadrat. Sampling began at the southwest corner of each quadrat and continued around the quadrat in a clockwise direction. The species located precisely at every 0.5-meter point was tallied, including areas of bare ground, rock and other.

## RESULTS

Below are the average data collected for the hydroseed, imprint, and hand broadcast application areas. The number in parenthesis represents the previous quarterly monitoring results.

### Quadrat Sampling:

#### *Average Hydroseed – Quadrats A, B, C, D*

Percent basil cover (shrubs) – 2% (2%)  
 Percent basil cover (herbs) – 1% (2%)  
 Percent bare ground – 62% (73%)  
 Percent rock or other – 5% (5%)  
 Percent canopy (shrub) – 23% (24%)  
 Percent canopy (herb) – 7% (4%)

#### *Average Imprint – Quadrats E, F, G H*

Percent basil cover (shrubs) – 10% (10%)  
 Percent basil cover (herbs) – 2% (4%)  
 Percent bare ground – 74% (72%)  
 Percent rock or other – 5% (5%)  
 Percent canopy (shrub) – 9% (22%)  
 Percent canopy (herb) – 15% (2%)

#### *Average Hand Broadcast – Quadrats I, J, K L (average)*

Percent basil cover (shrubs) – 4% (1%)  
 Percent basil cover (herbs) – 5% (7%)  
 Percent bare ground – 68% (71%)  
 Percent rock or other – 7% (7%)  
 Percent canopy (shrub) – 15% (8%)  
 Percent canopy (herb) – 2% (22%)

*\*Areas covered in desiccated plant material and leaf litter included as bare ground.*

### Point Intercept:

The representation of each species within a quadrat was estimated by broad cover classes (<1%, 1-5%, 5-25%, 25-50%, 50-75% and >75%). The percent cover of each species based on the point intercept method is presented in the following tables.

### Hydroseed– Quadrats A, B, C, D (average)

## DISCUSSION

The majority of the Landfill's City South 'C' Trial Plot area is still in recovery from the 2019 Saddleridge Fire. With the exception of quadrats A, B E, F and G, the remainder quadrats burned entirely. Fire equipment, such as bulldozers, removed and/or crushed the vegetation that did not burn in quadrats A, B E, F and G. Most of the stakes that marked to corners of the sampling quadrats were removed by fire equipment and personnel or were burned from the fire; however, the quadrats have since been re-staked and are now recognizable.

The City South 'C' area was planted in 2014, and prior to the Saddleridge Fire, had become relatively densely covered with native vegetation that was mostly dominated with saltbush and bush sunflower. Other natives duly noted throughout the area included purple, black sage and California buckwheat. Seedlings of native sages are prevalent, and *Atriplex* species have recovered somewhat since the last monitoring period. The dense mats of non-native grasses comprised of bromes (*Bromus sp.*) and barley (*Hordeum vulgare*) have been removed by ongoing weeding, which has significantly reduced the cover of these noxious species. It is expected that the successional regrowth of herbaceous species and native shrubs will continue and hopefully there is a native seedbank that will germinate during the 2020/2021 rainy season.

Wildfires in Southern California have become more common in recent years and have impacted on the native landscape including established restoration sites. Direction that has been provided from such organizations as the California Department of Fish and Wildlife Service and the California Society of Ecological Restoration, recommending that revegetation efforts be focused on non-native weed control for reestablishing restoration sites, including previously undisturbed areas. Successional regrowth of herbaceous non-native species is to be expected within the first two to three years following a wildfire, and native shrubs will recover over a longer period of time through germination of existing seed within the topsoil and basal growth from charred plants. Successional growth of herbaceous species is important for providing natural erosion of topsoil. As the native shrubs begin to sprout, it is essential to control the spread the non-native herbaceous layer to minimize competition for water, nutrients and sunlight. Therefore, during the first two to three years following the fire, weed maintenance should occur no less than every four months, and special attention should be afforded to minimizing impacts to native seedlings and resprouts.

# memorandum

**date** October 30, 2020

**to** Tuong-phu Ngo, Environmental Manager, Republic Services

**from** Greg Ainsworth, Consulting Biologist

**subject** Coastal Sage Scrub City South B Trial Plot Monitoring Report, Sunshine Canyon Landfill – 3<sup>rd</sup> Quarter, 2020

---

## 1.0 METHODS

On October 6, 2020, biologist Greg Ainsworth monitored the Deck B Coastal Sage Scrub Revegetation at the Landfill, which constitutes the 3<sup>rd</sup> quarter monitoring for 2020. The sample methodology generally followed the *Methodology for Monitoring Percent Cover and Species Richness within Each Seeded Application Method on the Coastal Sage Scrub Pilot Project at the Sunshine Canyon Landfill* (JMA, April 23, 2014). Quadrat sampling of the revegetation area consists of nine, 50-meter quadrats that are randomly sampled throughout the revegetation area. The quadrats were randomly selected prior to the first initial monitoring event from a grid that was placed over the entire trial plot, and each quadrat was given a letter (A-I) and delineated in the field with wooden stakes. As shown on the attached planting plan, five different planting methods were used as follows:

- Soil imprinting with hand broadcast overseeded drainage swales (Quadrats A and G)
- Soil imprinting (Quadrats B, F and H)
- Broadcast seeding (Quadrat C)
- Broadcast seeding with soil imprinting (Quadrat D and I)
- Soil imprinting and hand broadcast (Quadrat E)

### 1.1 Absolute Cover

The following data was collected in each quadrat to determine the absolute cover of native and non-native herbaceous and woody species:

- **Percent basil cover (shrubs)** – Visual estimate of the amount of basil cover within each quadrat for all shrub species.
- **Percent basil cover (herbs)** – Visual estimate of the amount of basil cover within each quadrat for all herb species.
- **Percent bare ground** – Visual estimate of the amount of available bare ground with no vegetation, but suitable for plant growth.

- **Percent rock or other** – Visual estimate of the amount of unavailable ground for supporting plant growth. Inhibitors generally included rocks and boulders, irrigation lines and valve boxes, and mulch.
- **Percent canopy** – Visual estimate of the percent canopy of each shrub and herbaceous species.
- **Photographs** – A photograph was taken from the southwest corner (facing northeast) of each quadrat.

## 1.2 Percent Cover

The following data was collected in each quadrat to determine the percent cover of native and non-native species.

- **Point intercept method** - Sampling began at the southwest corner of each quadrat and continued around the quadrat in a clockwise direction. The species located precisely at every 0.5-meter point was tallied, including areas of bare ground, rock and other.

## 2.0 RESULTS

Below are the average data collected for each planting method. The percentages in parentheses indicates the result of the previous monitoring period.

### 2.1 Quadrat Sampling

#### ***Soil imprinting with hand broadcast overseeded drainage swales - Quadrats A and G (average)***

Percent basil cover (shrubs) – 4% (4%)

Percent basil cover (herbs) – 1% (20%)

Percent bare ground – 93% (78%)

Percent rock or other – 4% (4%)

Percent canopy (shrub) – 7% (9%)

Percent canopy (herb) – 4% (35%)

#### ***Soil imprinting - Quadrats B, F and H (average)***

Percent basil cover (shrubs) – 4% (4%)

Percent basil cover (herbs) – 3% (37%)

Percent bare ground – 35% (35%)

Percent rock or other – 3% (3%)

Percent canopy (shrub) – 20% (19%)

Percent canopy (herb) – 2 (57%)

#### ***Broadcast seeding - Quadrat C***

Percent basil cover (shrubs) – 2% (2%)

Percent basil cover (herbs) – 2% (7%)

Percent bare ground – 80% (80%)

Percent rock or other – 3% (3%)

Percent canopy (shrub) – 20% (18%)

Percent canopy (herb) – 3% (26%)

***Broadcast seeding with soil imprinting - Quadrat D and I (average)***

Percent basil cover (shrubs) – 2% (2%)

Percent basil cover (herbs) – 2% (45%)

Percent bare ground – 37% (35%)

Percent rock or other – 7% (7%)

Percent canopy (shrub) – 10% (9%)

Percent canopy (herb) – 4% (78%)

***Soil imprinting and hand broadcast - Quadrat E***

Percent basil cover (shrubs) – 3% (3%)

Percent basil cover (herbs) – 1% (27%)

Percent bare ground – 78% (25%)

Percent rock or other – 3% (3%)

Percent canopy (shrub) – 15% (14%)

Percent canopy (herb) – 1% (64%)

*\*Percent bare ground includes desiccated plant material*

2.2 Point Intercept

The representation of each species within a quadrat was estimated by broad cover classes (<1%, 1-5%, 5-25%, 25-50%, 50-75% and >75%). The percent cover of each species based on the point intercept method is presented in the following tables.

Table 1. Soil imprinting with hand broadcast overseeded drainage swales - Quadrats A and G (average)

	Soil imprinting with hand broadcast overseeded drainage swales						
		Quadrat A	Quadrat G	Number of Hits	Percent Cover

### 3.0 DISCUSSION

Table 6 below provides a summary of the percent cover of native and non-native shrubs and herbs, including areas of bare ground.

**Table 6. Summary of Percent Cover for Each Planting Method**

	Soil imprinting w/ hand broadcast overseeded drainage swales	Soil imprinting	Broadcast seeding	Broadcast seeding w/ soil imprinting	Soil imprinting and hand broadcast
Percent Cover Native Shrub	7%	12%	4%	7%	12%
Percent Cover Native Herb	0%	2%	0%	1%	0%
Percent Cover Non-Native Shrub	0%	0%	0%	0%	0%
Percent Cover Non-Native Herb	0%	0%	0%	0%	2%
Percent Bare Ground	93%	55%	96%	92%	87%

The Deck B Revegetation Area was planted in November 2018. The recent Saddleridge Fire in October 2019 scorched a lot of the Deck B area, but largely spared the sample plots. However, the intense heat from the fire dried out a lot of the vegetation within the sample plots and the irrigation throughout the Deck B area was damaged and no longer appears to be functioning. Winter rains in December and spring rains in April germinated a lot of non-native grass seed. These non-native grasses were prevalent during the previous monitoring period, many of which have senesced, and also ongoing weed control activities appear to have suppressed. A minimal amount of native plant recruitment is noticeable within the trial plots.

Wildfires in Southern California have become more common in recent years and have impacted on the native landscape including established restoration sites. Direction that has been provided from such organizations as the California Department of Fish and Wildlife Service and the California Society of Ecological Restoration, recommending that revegetation efforts be focused on non-native weed control for reestablishing restoration sites, including previously undisturbed areas. Successional regrowth of herbaceous non-native species is to be expected within the first two to three years following a wildfire, and native shrubs will recover over a longer period of time through germination of existing seed within the topsoil and basal growth from charred plants. Successional growth of herbaceous species is important for providing natural erosion of topsoil. As the native shrubs begin to sprout, it is essential to control the spread the non-native herbaceous layer to minimize competition for water, nutrients and sunlight. Therefore, during the first two to three years following the fire, weed maintenance should occur no less than every four months, and special attention should be afforded to minimizing impacts to native seedlings and resprouts.
