

K-8 and Division Street Booster Pump Station

This project involved the design and construction of a new booster pumping station, including piping and appurtenances, in the city of Lancaster, serving the 2555 and 2696 pressure zones. The newly constructed booster station has improved the reliability of the water supply in Lancaster by replacing an existing, aging, booster station which was demolished and hauled away. The new booster station served also as an upgraded to accommodate the flows from two additional wells.

Construction of this project was completed in September 2011.
